Set-Theoretic Methods in Control

Birkhäuser
Boston • Basel • Berlin

Contents

Preface	vii
1 Introduction	1
1.1 Notation	1
1.1.1 Acronyms	3
1.2 Basic ideas and motivations	3
1.2.1 The spirit of the book	3
1.2.2 Solving a problem	5
1.2.3 Conservative or intractable?	6
1.2.4 How to avoid reading this book	8
1.2.5 How to benefit from reading this book	9
1.2.6 Past work referencing	9
1.3 Outline of the book	9
1.3.1 The link with Lyapunov's theory	10
1.3.2 Uncertain systems	13
1.3.3 Constrained control	18
1.3.4 Required background	25
1.4 Related topics and reading	26
2 Lyapunov and Lyapunov-like functions	27
2.1 State space models	27
2.1.1 Differential inclusions	29
2.1.2 Model absorbing	30
2.1.3 The pitfall of equilibrium drift	32
2.2 Lyapunov derivative	34
2.2.1 Solution of a system of differential equations	34
2.2.2 The upper-right Dini derivative	35
2.2.3 Derivative along the solution of a differential equation ..	36
2.2.4 Special cases of directional derivatives	37
2.3 Lyapunov functions and stability	39
2.3.1 Global stability	40

2.3.2	Local stability and ultimate boundedness	43
2.4	Control Lyapunov Functions	45
2.4.1	Associating a control law with a Control Lyapunov Function: state feedback	46
2.4.2	Associating a control law with a Control Lyapunov Function: output feedback	53
2.4.3	Finding a Control Lyapunov Function	54
2.4.4	Polytopic systems	54
2.4.5	The convexity issue	57
2.4.6	Fake Control Lyapunov Functions	57
2.5	Lyapunov-like functions	60
2.6	Discrete-time systems	62
2.6.1	Converse Lyapunov theorems	68
2.6.2	Literature review	69
2.7	Exercises	70
3	Convex sets and their representation	73
3.1	Convex functions and sets	73
3.1.1	Operations between sets	76
3.1.2	Minkowski function	79
3.1.3	The normal and the tangent cones	81
3.2	Ellipsoidal sets	83
3.3	Polyhedral sets	86
3.4	Other families of convex sets	94
3.5	Exercises	96
4	Invariant sets	99
4.1	Basic definitions	99
4.2	Nagumo's theorem	101
4.2.1	Proof of Nagumo's theorem for practical sets and regular f	104
4.2.2	Generalizations of Nagumo's theorem	106
4.2.3	An example of application of Nagumo's theorem	108
4.2.4	Discrete-time systems	110
4.2.5	Positive invariance and fixed point theorem	112
4.3	Convex invariant sets and linear systems	114
4.4	Ellipsoidal invariant sets	120
4.4.1	Ellipsoidal invariant sets for continuous-time systems	120
4.4.2	Ellipsoidal invariant sets for discrete-time systems	124
4.5	Polyhedral invariant sets	125
4.5.1	Contractive polyhedral sets for continuous-time systems	126
4.5.2	Contractive sets for discrete-time systems	135
4.5.3	Associating a control with a polyhedral control Lyapunov function and smoothing	138
4.5.4	Existence of positively invariant polyhedral C-sets	142

4.5.5	The positive description	143
4.6	Other classes of invariant sets and historical notes	144
4.7	Exercises	146
5	Dynamic programming	149
5.1	Infinite-time reachability set	149
5.1.1	Linear systems with linear constraints	156
5.1.2	State in a tube: time-varying and periodic case	164
5.1.3	Historical notes and comments	167
5.2	Backward computation of Lyapunov functions	168
5.3	The largest controlled invariant set	171
5.4	The uncontrolled case: the largest invariant set	179
5.4.1	Comments on the results	184
5.5	Exercises	188
6	Set-theoretic analysis of dynamic systems	191
6.1	Set propagation	191
6.1.1	Reachable and controllable sets	191
6.1.2	Computation of set propagation under polytopic uncertainty	194
6.1.3	Propagation of uncertainties via ellipsoids	197
6.2	0-Reachable sets with bounded inputs	198
6.2.1	Reachable sets with pointwise-bounded noise	198
6.2.2	Infinite-time reachability and l_1 norm	207
6.2.3	Reachable sets with energy-bounded noise	209
6.2.4	Historical notes and comments	212
6.3	Stability and convergence analysis of polytopic systems	212
6.3.1	Quadratic stability	213
6.3.2	Joint spectral radius	213
6.3.3	Polyhedral stability	215
6.3.4	The robust stability radius	217
6.3.5	Best transient estimate	218
6.4	Performance analysis of dynamical systems	220
6.4.1	Peak-to-peak norm evaluation	221
6.4.2	Step response evaluation	226
6.4.3	Impulse and frequency response evaluation	228
6.4.4	Norm evaluation via LMIs	229
6.5	Periodic system analysis	231
6.6	Exercises	233
7	Control of parameter-varying systems	235
7.1	Robust and gain-scheduling control	237
7.2	Stabilization of LPV systems via quadratic Lyapunov functions	241
7.2.1	Quadratic stability	242

7.2.2	Quadratic stabilizability	242
7.2.3	Quadratic Lyapunov functions: the discrete-time case	244
7.2.4	Quadratic stability and \mathcal{H}_∞ norm	245
7.2.5	Limits of quadratic functions and linear controllers	246
7.2.6	Notes about quadratic stabilizability	251
7.3	Polyhedral Lyapunov functions	251
7.3.1	Polyhedral stabilizability	251
7.3.2	Universality of polyhedral Lyapunov functions (and their drawbacks)	256
7.3.3	Smoothed Lyapunov functions	261
7.4	Gain-scheduling linear controllers and duality	263
7.4.1	Duality in a quadratic framework	267
7.5	Exercises	268
8	Control with time-domain constraints	271
8.1	Input constraints	274
8.1.1	Construction of a constrained control law and its associated domain of attraction	278
8.1.2	The stable-unstable decomposition	283
8.1.3	Systems with one or two unstable eigenvalues	284
8.1.4	Region with bounded complexity for constrained input control	291
8.2	Domain of attraction for input-saturated systems	295
8.3	State constraints	299
8.3.1	A case study	301
8.3.2	Assigning an invariant (and admissible) set	306
8.4	Control with rate constraints	312
8.4.1	The rate-bounding operator	314
8.5	Output feedback with constraints	315
8.6	The tracking problem	317
8.6.1	Reference management device	319
8.6.2	The tracking domain of attraction	324
8.6.3	Examples of tracking problems	330
8.7	Exercises	333
9	(Sub-)Optimal control	337
9.1	Minimum-time control	337
9.1.1	Worst-case controllability	337
9.1.2	Time optimal controllers for linear discrete-time systems	341
9.1.3	Time optimal controllers for uncertain systems	342
9.2	Optimal peak-to-peak disturbance rejection	347
9.3	Constrained receding-horizon control	352
9.3.1	Receding-horizon: the main idea	352
9.3.2	Recursive feasibility and stability	355

9.3.3	Receding horizon control in the presence of disturbances	360
9.4	Relatively optimal control	365
9.4.1	The linear dynamic solution	369
9.4.2	The nonlinear static solution	377
9.5	Exercises	386
10	Set-theoretic estimation	389
10.1	Worst-case estimation	390
10.1.1	Set membership estimation for linear systems with linear constraints	396
10.1.2	Approximate solutions	403
10.1.3	Bounding ellipsoids	408
10.1.4	Energy-bounded disturbances	408
10.2	Including observer errors in the control design	410
10.3	Literature review	412
10.4	Exercises	412
11	Related topics	415
11.1	Adaptive control	415
11.1.1	A surge control problem	420
11.2	The domain of attraction	425
11.2.1	Systems with constraints	426
11.3	Hybrid and switching systems	430
11.3.1	Switching and switched systems	432
11.3.2	Switching among controllers	436
11.3.3	Relay systems	441
11.4	Planar systems	447
11.5	Exercises	449
12	Appendix	451
12.1	Remarkable properties of the Euler auxiliary system	451
12.2	MAXIS-G: a software for the computation of invariant sets for constrained LPV systems	456
12.2.1	Software availability	458
12.2.2	Web addresses	458
	References	459
