

Hans Wilhelm Alt

Linear Functional Analysis

An Application-Oriented Introduction

Translated by Robert Nürnberg

 Springer

Table of Contents

1	Introduction	1
2	Preliminaries	9
	2.1 Scalar product	9
	2.3 Orthogonality	11
	2.4 Norm	13
	2.6 Metric	16
	2.8 Examples of metrics	16
	2.9 Balls and distance between sets	18
	2.10 Open and closed sets	19
	2.11 Topology	19
	2.14 Comparison of topologies	21
	2.15 Comparison of norms	21
	2.17 Convergence and continuity	23
	2.18 Convergence in metric spaces	24
	2.21 Completeness	27
	2.22 Banach spaces and Hilbert spaces	27
	2.23 Sequence spaces	28
	2.24 Completion	30
E2	Exercises	31
	E2.6 Completeness of Euclidean space	34
	E2.7 Incomplete function space	34
	E2.9 Hausdorff distance between sets	35
3	Function spaces	37
	3.1 Bounded functions	37
	3.2 Continuous functions on compact sets	38
	3.3 Continuous functions	39
	3.4 Support of a function	41
	3.5 Differentiable functions	41
	3.7 Hölder continuous functions	44
	3.9 Measures	45
	3.10 Examples of measures	46
	3.11 Measurable functions	47

3.15	Lebesgue spaces	50
3.18	Hölder's inequality	52
3.19	Majorant criterion in L^p	55
3.20	Minkowski inequality	55
3.21	Fischer-Riesz theorem	55
3.23	Vitali's convergence theorem	57
3.25	Lebesgue's general convergence theorem	60
3.27	Sobolev spaces	63
E3	Exercises	66
E3.3	Standard test function	67
E3.4	L^p -norm as $p \rightarrow \infty$	67
E3.6	Fundamental theorem of calculus	68
A3	Lebesgue's integral	71
A3.3	Elementary Lebesgue measure	72
A3.4	Outer measure	73
A3.5	Step functions	74
A3.6	Elementary integral	75
A3.8	Lebesgue integrable functions	78
A3.10	Axioms of the Lebesgue integral	79
A3.14	Integrable sets	84
A3.15	Measure extension	87
A3.18	Egorov's theorem	90
A3.19	Majorant criterion	91
A3.20	Fatou's lemma	93
A3.21	Dominated convergence theorem	94
4	Subsets of function spaces	95
4.1	Convexity	95
4.3	Projection theorem	96
4.5	Almost orthogonal element	99
4.6	Compactness	100
4.12	Arzelà-Ascoli theorem (compactness in C^0)	106
4.13	Convolution	107
4.14	Dirac sequences	110
4.16	Riesz theorem (compactness in L^p)	112
4.18	Examples of separable spaces	115
4.19	Cut-off function	118
4.20	Partition of unity	118
4.22	Fundamental lemma of calculus of variations	122
4.23	Local approximation of Sobolev functions	122
4.25	Product rule for Sobolev functions	124
4.26	Chain rule for Sobolev functions	125
E4	Exercises	126
E4.4	Strictly convex spaces	128
E4.5	Separation theorem in \mathbb{R}^n	129

E4.6	Convex functions	129
E4.7	Characterization of convex functions	131
E4.8	Supporting planes	132
E4.9	Jensen's inequality	133
E4.11	The space L^p for $p < 1$	134
E4.13	Compact sets in ℓ^2	135
E4.15	Comparison of Hölder spaces	136
E4.16	Compactness with respect to the Hausdorff metric	137
E4.18	Continuous extension	138
E4.19	Dini's theorem	139
E4.20	Nonapproximability in $C^{0,\alpha}$	139
E4.21	Compact sets in L^p	139
5	Linear operators	141
5.2	Linear operators	142
5.7	Neumann series	146
5.8	Theorem on invertible operators	147
5.9	Analytic functions of operators	147
5.10	Examples (exponential function)	148
5.12	Hilbert-Schmidt integral operators	149
5.14	Linear differential operators	151
5.17	Distributions (The space $\mathcal{D}'(\Omega)$)	152
5.20	Topology on $C_0^\infty(\Omega)$	156
5.21	The space $\mathcal{D}(\Omega)$	157
E5	Exercises	160
E5.3	Unique extension of linear maps	160
E5.4	Limit of linear maps	161
6	Linear functionals	163
6.1	Riesz representation theorem	163
6.2	Lax-Milgram theorem	164
6.4	Elliptic boundary value problems	167
6.5	Weak boundary value problems	169
6.6	Existence theorem for the Neumann problem	170
6.7	Poincaré inequality	171
6.8	Existence theorem for the Dirichlet problem	171
6.10	Variational measure	173
6.11	Radon-Nikodým theorem	173
6.12	Dual space of L^p for $p < \infty$	175
6.14	Hahn-Banach theorem	180
6.15	Hahn-Banach theorem (for linear functionals)	182
6.20	Spaces of additive measures	185
6.21	Spaces of regular measures	185
6.23	Riesz-Radon theorem	187
6.25	Functions of bounded variation	191

E6	Exercises	193
E6.1	Dual norm on \mathbb{R}^n	193
E6.2	Dual space of the cross product	194
E6.3	Integral equation	194
E6.5	Dual space of $C^m(I)$	195
E6.6	Dual space of c_0 and c	198
E6.8	Positive functionals on C_0^0	199
E6.9	Functions of bounded variation	201
A6	Results from measure theory	205
A6.1	Jordan decomposition	205
A6.2	Hahn decomposition	206
A6.5	Alexandrov's lemma	210
A6.7	Luzin's theorem	212
A6.8	Product measure	213
A6.10	Fubini's theorem	215
7	Uniform boundedness principle	219
7.1	Baire category theorem	219
7.2	Uniform boundedness principle	220
7.3	Banach-Steinhaus theorem	220
7.7	Open mapping theorem	222
7.8	Inverse mapping theorem	223
7.9	Closed graph theorem	224
E7	Exercises	224
E7.2	Pointwise convergence in $\mathcal{L}(X; Y)$	225
E7.4	Sesquilinear forms	226
8	Weak convergence	227
8.1	Weak convergence	227
8.2	Embedding into the bidual space	228
8.7	Weak topology	233
8.8	Reflexivity	234
8.12	Separation theorem	240
8.14	Mazur's lemma	241
8.16	Generalized Poincaré inequality	242
8.17	Elliptic minimum problem	244
E8	Exercises	249
E8.4	Weak convergence in $C^0(S)$	251
E8.7	Weak convergence of oscillating functions	254
E8.8	Variational inequality	255
A8	Properties of Sobolev functions	258
A8.1	Rellich's embedding theorem in $W_0^{m,p}(\Omega)$	258
A8.2	Lipschitz boundary	259
A8.3	Localization	261
A8.4	Rellich's embedding theorem in $W^{m,p}(\Omega)$	261

A8.5	Boundary integral	263
A8.6	Trace theorem	268
A8.8	Weak Gauß's theorem	270
A8.12	Extension theorem for Sobolev functions	275
A8.13	Embedding theorem onto the boundary	276
A8.14	Weak sequential compactness in $L^1(\mu)$	277
A8.15	Vitali-Hahn-Saks theorem	282
9	Finite-dimensional approximation	285
9.3	Schauder basis	288
9.4	Dual basis	288
9.6	Bessel's inequality	292
9.7	Orthonormal basis	292
9.10	Weierstraß approximation theorem	296
9.13	Linear projections	299
9.14	Continuous projections	300
9.15	Closed complement theorem	301
9.21	Piecewise constant approximation	305
9.22	Continuous piecewise linear approximation	309
9.23	Ritz-Galerkin approximation	311
9.25	Céa's lemma	312
E9	Exercises	313
E9.1	Hamel basis	313
E9.2	Discontinuous linear maps	313
E9.8	Projections in $L^2([-\pi, \pi])$	316
10	Compact operators	319
10.1	Compact operators	319
10.6	Embedding theorem in Hölder spaces	325
10.7	Sobolev number	327
10.8	Sobolev's theorem	329
10.9	Embedding theorem in Sobolev spaces	333
10.11	Morrey's theorem	335
10.13	Embedding theorem of Sobolev spaces into Hölder spaces	337
10.14	Inverse Laplace operator	339
10.15	Hilbert-Schmidt integral operator	340
10.16	Schur integral operators	342
10.17	Fundamental solution of the Laplace operator	346
10.18	Singular integral operators	348
10.19	Hölder-Korn-Lichtenstein inequality	349
10.20	Calderón-Zygmund inequality	351
E10	Exercises	352
E10.2	Ehrling's lemma	353
E10.8	Sobolev spaces on \mathbb{R}^n	356
E10.9	Embedding theorem in \mathbb{R}^n	356

E10.10	Poincaré inequalities	357
E10.13	Nuclear operators	358
E10.15	Bound on the dimension of eigenspaces	359
A10	Calderón-Zygmund inequality	361
11	Spectrum of compact operators	373
11.6	Fredholm operators	376
11.9	Spectral theorem for compact operators	381
11.11	Fredholm alternative	385
11.12	Finite-dimensional case	385
11.13	Jordan normal form	386
11.14	Real case	387
12	Self-adjoint operators	389
12.1	Adjoint operator	389
12.2	Hilbert adjoint	389
12.4	Annihilator	390
12.6	Schauder's theorem	391
12.8	Fredholm's theorem	393
12.9	Normal operators	393
12.12	Spectral theorem for compact normal operators	395
12.14	Eigenvalue problem as a variational problem	397
12.15	Self-adjoint integral operator	399
12.16	Eigenvalue problem for the Laplace operator	400
E12	Exercises	407
E12.1	Adjoint map on C^0	407
A12	Elliptic regularity theory	412
A12.2	Friedrichs' theorem	413
